What people refer to as transients in power systems are the fast and significant changes in system parameters, in most cases caused by equipment outages due to malfunction, natural conditions such as heavy wind, lighting etc, or human errors.

What is transient in electrical power systems? - Quora

One of the causes of the creation of such transients is that of Lightning. Their mode of action is usually indirect and exerts it through affecting the power line. They generate induced transients by coupling into the power system. Another cause is that of the routine utility tasks which include: Facility load switches.

Home / What is an electrical transient? Electrical transients are momentary bursts of energy induced upon power, data, or communication lines. They are characterized by extremely high voltages that drive tremendous amounts of current into an electrical circuit for a few millionths, up to a few thousandths, of a second.
