$x = 3.00$  mol of  $\text{H}_2$  was consumed. Notice that the above solution used the answer from example #5. The solution below uses the information given in the original problem: Solution #2: The  $\text{H}_2 / \text{H}_2\text{O}$  ratio of  $2/2$  could have been used also. In that case, the ratio from the problem would have been  $3.00$  over  $x$ , since you were now using the water data and not the oxygen data.

Squaring numbers and finding square roots of numbers are common mathematical tasks that you are likely to find in math classrooms from upper elementary school on through college. A square is

a number times itself. Another way of stating this is a number raised to the second power. Finding a square root is the opposite of squaring a number.

A combustion reaction occurs when a reactant combines with oxygen, many times from the atmosphere, to produce oxides of all other elements as products; any nitrogen in the reactant is converted to elemental nitrogen, N<sub>2</sub>. Many reactants, called fuels, contain mostly carbon and hydrogen atoms, reacting with oxygen to produce CO<sub>2</sub> and H<sub>2</sub>O. For example, the balanced chemical equation for the ...
